QUIET OPS // POST 3 LEAVE-BEHIND

The Knowledge Your Business Already Paid For

The Open Knowledge Format (OKF, an open standard from Google Cloud) used for company memory: knowledge that belongs to the company, not to whoever wrote it.

WHAT IT IS

A shared, searchable record of how operations runs: procedures, decisions, checklists, answers. It is the company's memory, not one person's second brain, so it survives people changing roles.

TWO FILES, TWO READERS

README.md
For **people**. Why the folder exists, what belongs, how to use it.

index.md
For **agents**. What each file is, who owns it, how fresh it is, and what is below.

Neither needs the whole folder read. A person reads the README. An agent reads the index and opens only the file it needs.

FIVE RULES

1. **Findable in seconds.** Search first. Never guess a file name.
2. **Front matter on every document:** title, type, status, owner, review date.
3. **Every folder has a README and an index.**
4. **Archive, never delete.** Mark it archived or superseded.
5. **One owner and a review date** per document.

THE 90-SECOND TEST

Can a capable new hire find it, read it and act on it in 90 seconds? Every procedure answers five things:

1. **Question**: what is someone actually asking?
2. **Answer**: the plain answer.
3. **Next step**: the one thing to do now.
4. **Owner**: who keeps it right.
5. **Review date**: when it is next checked.

WHAT A FOLDER LOOKS LIKE

```
operations-knowledge/
  README.md       for people
  index.md        for agents
  procedures/
    README.md
    index.md
    TEMPLATE_90-second-sop.md
    sop-vendor-invoice-approval.md
```

START ON MONDAY

1. Pick one folder.
2. List the five questions people ask most.
3. Write each as a 90-second procedure.
4. Give each an owner and a review date.
5. Add one line each to the index.
6. Ask the newest hire to find an answer. Fix what they could not.
